Joshua Lederberg, M.D. Prof. of Genetics Stanford University Medical Center Stanford, California 94305

Dear Dr. Lederberg:

My article in "Mother's Manual" did not mean to imply that muscular dystrophy could be diagnosed by amniocenthesis. The article from which I was quoting was "Clinical Obstetrics and Gynecology" Vol. 13, March 1970 on "Recent Advances in Antenatal Diagnosis by Amniotic Fluid Analysis" by Fritz Fuchs and Lars Cederqvist.

The exact quote from their article is,
"Antenatal sex determination can be used in the
prevention of sex-linked hereditary disorders.
The method does not permit a direct diagnosis
of the diseases, but since only one sex, the male,
with rare exceptions is suffering from the diseases
the method permits more selective preventive
measures. The most frequent of the severe sexlinked recessive orders are hemophilia, one form
of muscular dystrophy and Hunter's disease."

Thank you for bringing this to my attention. I realize in re-reading this paragraph that this statement I made ambiguous.

Since rely,

George Schaefer, M.D.
